#### **GENERAL CHARACTERISTICS**

Two-component epoxy-polyamide primer with zinc phosphates specially formulated for application on oxidized ferrous substrates. Due to its peculiar ability to protect oxidized substrates, it is particularly suitable for application on these substrates for exposure in corrosive atmospheres, for use in the chemical industry, oil industry, food industry, shipbuilding and industrial bodywork, in combination with epoxy and polyurethane finishes, rapid drying, etc.. finding use mainly in on-site maintenance.

COMPLETE DRYING	15 days	
Particularly cold temperatu	res or environments with high relative	
humidity can slow down or m	odify the characteristics of the system,	
which is affected during the painting phase by atmospheric conditions.		
It is therefore recommended to apply and dry the system initially in		
environments with a temperat	ure of more than 10-15 °C and a maximum	
relative humidity of 75 %.		
OVERPAINTING		
Overpaintable after 8 h and within 48 h (without sanding, after 48 h it		
-	en the surfaces by a slight mechanical	
roughening).		
ENVIRONMENTAL CONDITIONS		
At temperatures above 25-30°C it is advisable to use a special		
retardant thinner or a larger quantity of the thinner usually used, in		
order to avoid the formation of dots and bubbles (pin points) on the		
paint film.		
Light rain, high humidity or condensation during the 16 hours after		
application (20°C) can irreversibly corrupt the film formation.		
The temperature must be at least 3 degrees above dew point.		
SURFACES PREPARATION		
The oxidized ferrous support to be painted must be previously brushed		
to remove rust that is not well anchored and then degreased. In case of		
pre-existing coatings, make sure that they can be overpainted with		
VIVEPOX FONDO RUSTLINKER (also by testing), remove the parts of paint		
that are not well anchored to the piece (by mechanical treatments) and
